published:31 Mar 2017 views:1086 From the Oklahoma Oil & Gas Energy Expo - published:22 Sep 2013 views:470 From Oil Pads to Pipelines, the Energy Industry is transforming at a rapid pace. New technology, pioneered in Canada, is enabling Canada to lead the adoption of hydraulic fracturing (fracking) in the oil and gas industry, and numerous professional and graduate programs are available for those looking to enter the expanding field of oil and gas development. Early interest in the energy sector and natural resources followed agreement of the NationalEnergy Code, resulting in new environmental assessment (EA) regulations. In the face of severe criticism for not having produced a diminishing resource, Canadian courts and regulators successfully challenged the government's authority to authorize new resource projects, save for extremely limited exceptions, and a new Energy Minister was appointed. In spite of these challenges, the government was able to avoid suspending activities in the sector, with the approval of an "energy summer" plan that saw an increase in exploration and drilling. The government's support for the energy industry has not gone unnoticed. In addition to the stable regulatory regime, other policies have created new sources for capital. Examples include major funding for the Northern Pass project in New Hampshire and New England, and major equity investments in Canadian energy companies.

perovskite film). This reference shows that the T₂ thermal transition temperature T_c (40.5° C.) of the acetonitrile solvent is at the same temperature range as the eutectic temperature. This reference further shows that the thickness of the photorefracting film 3 decreases

from 20 nm (0.0005 inch/37° C.) to 6 nm (0.0012 inch/37° C.) when the temperature varies from 50° C. to -40° C. Such a variation in thickness requires compensation to maintain the efficiency of the recording and reading head. Moreover, such a temperature range may induce thermal expansion that will lead to an offset in the crystal structure. Therefore, the prior art photorefracting films may cause offset in the crystal structure, show decreased resistance of a $Tb_xFe_{100-x}O_{200}$ active recording layer, and decrease the HSM voltage (magnetization per unit volume). Further, all of the examples in the prior art are directed to the cathode side of the SLM's R/W recording layer. As noted above, the reason that the heat induced structural changes in the commonly used anodized alumina substrate occur in the substrate (and not in the R/W layer) is that the R/W layer cannot conduct heat due to its limited thickness (typically a few hundred Angstroms) and since it is sandwiched between the harder alumina layers. In summary, the prior art data storage devices (
