Technological advances in AutoCAD AutoCAD 2000 introduced the ability to export to PDF and import to the program through the use of the Raster to Vector (RVT) converter. The viewer could also be embedded into the drawing itself. A viewer program that did this was AutoCAD Viewer. AutoCAD Viewer was later replaced by AutoCAD LT Viewer. AutoCAD 2003 introduced support for large-scale programs, as well as the ability to work in a page-based interface, with the addition of the "Page Setup" dialog box. This was the first version that allowed the creation of drawings in a single screen interface. AutoCAD 2004 introduced AutoLISP, an extension language with complete programming constructs. It was first implemented as a standalone add-on module that would be invoked from AutoCAD through AutoLISP. AutoLISP is the most powerful, most feature rich and most commonly used programming language for AutoCAD. It allows the creation of Customized Commands, User-defined Functionalities and User-defined Plug-ins, which may be added to AutoCAD as well as interact with other, existing add-ons, such as native or stand-alone application developers. Users can make use of any programming language. AutoLISP, VBA,.NET, AutoCAD C++ and other programming languages are supported. AutoCAD 2010 introduced Autodesk Cloud APIs, which allow cloud-based versions of AutoCAD or other Autodesk products to be developed by third parties. This allows users to access and view drawings without downloading them. AutoCAD added the ability to convert drawing files to other file formats such as PDF, EPS, SVG, and so on, as well as the ability to easily access DWG, DXF, and other Autodesk file formats. AutoCAD 2012 introduced a new Windows Shell interface, with integration of the Metro interface and a new 3D and multi-monitor view. It also includes a solid object move tool, a multifunction tool that can be used to copy, cut, and move objects on drawings as well as the ability to flip the view or turn off the viewer entirely. AutoCAD 2013 introduced AutoLISP 2015. A new programming language based on Fortran 90, it is designed to run in the context of AutoCAD on all platforms and it supports direct access to the on-screen application status. It also includes a new Navigate To command ca3bfb1094

Q: How to get then'th period of a string in Python? In Python, given a string s and a number n, I want to get all of then'th period in s, i.e. I want all of the periods that are n times longer than the previous period in s. How can I do that? Note: I know that there's no period in a string, just a period that is n times longer. A: A simple approach: def period_finder(s, n): h = None for i in range(len(s)-n+1): if s[i] == '.' and h is None: h = s[i:i+1] continue h = s[i:i+1] return h print(period_finder("a.", 3)) This is basically the same as Jelon's answer, but it's slightly shorter and clearer. A: I like @Coritos' approach, it is short and does exactly what you want. In case you don't want to create the string in memory, you can use a generator: def get_nth_period(s, n): h = None for i in range(len(s)-n+1): if s[i] == '.' and h is None: h = s[i:i+1] continue h = s[i:i+1] return h
